

QA Assignment – Amazon Testing & UAT.

Objective

The objective of this testing assignment was to evaluate the Amazon India web experience from a user's perspective. The testing covered the journey from product discovery and search to product selection, cart, and checkout up to the login/payment stage.

The testing focused on:

1. Functional testing
2. Exploratory testing
3. Identifying bugs and edge cases
4. User experience and usability observations
5. UAT feedback

Test Environment

1. Website: Amazon India
2. URL: Amazon.in
3. Browsers Tested: Google Chrome and Microsoft Edge
4. Testing Type: Functional Testing, Exploratory Testing and UAT
5. Test Scope: Search → Product Selection → Cart → Checkout/Login Stage

Bug Reports

Bug 1: Account Registration Accepts Invalid Name and Proceeds to OTP

Verification

Severity: Medium

Type: Input Validation / Functional Issue

Steps to Reproduce

1. Open the Amazon India website.

2. Navigate to Create Account.
3. Enter valid details in the required fields.
4. In the Your Name field, enter an invalid value containing only numbers or special characters.
5. Enter a valid mobile number.
6. Click Continue.

Expected Result

The system should validate the Your Name field and reject invalid values such as numeric-only or special-character-only input.

Actual Result

The Your Name field accepted invalid input, and the registration process proceeded to the OTP verification page without displaying a validation error.

Impact

Invalid user information can be accepted during account registration, resulting in incorrect account details.

Evidence

Screenshot 1: Invalid name entered in the registration form.

The screenshot displays the Amazon.in 'Create Account' page. At the top is the Amazon.in logo. Below it, the title 'Create Account' is centered. The 'Mobile number' section includes a dropdown menu set to 'IN +91' and a text input field containing '6909688773'. The 'Your name' section has a text input field containing '1234@', which is highlighted with a blue border. Below the name field, a message states: 'To verify your number, we will send you a text message with a temporary code. Message and data rates may apply.' A yellow button labeled 'Verify mobile number' is positioned below this message. At the bottom of the form, there is a link for 'Already a customer? Sign in instead' and a footer note: 'By creating an account or logging in, you agree to Amazon's [Conditions of Use](#) and [Privacy Policy](#).' The footer of the page includes links for 'Conditions of Use', 'Privacy Notice', and 'Help', along with the copyright notice '© 1996-2026, Amazon.com, Inc. or its affiliates'.

Screenshot 2: Registration proceeded to OTP verification despite the invalid name.

Bug 2: Products Are Not Properly Ordered When Sorted by “Avg. Customer Review”

Severity: Medium

Type: Sorting / Functional Issue

Steps to Reproduce

1. Open Amazon India.
2. Search for “wireless headphones.”
3. From the Sort by dropdown, select “Avg. Customer Review.”
4. Observe the customer ratings of the products displayed in the search results.
5. Refresh the page and verify the sorting order again.

Expected Result

Products should be displayed in a consistent order based on their average customer review ratings, with higher-rated products appearing before lower-rated products.

Actual Result

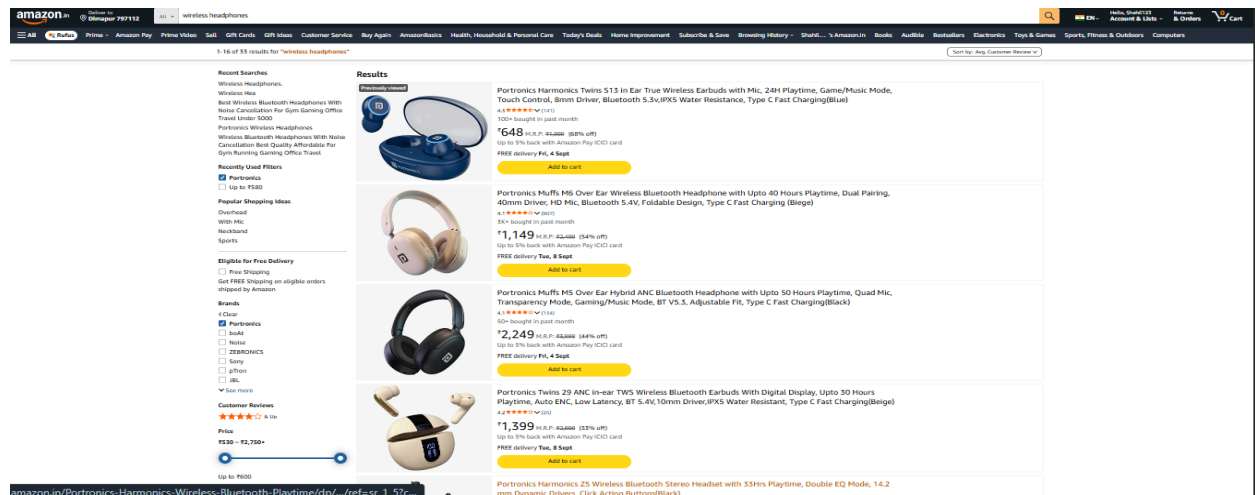

After selecting “Avg. Customer Review,” the products appeared in the following rating order:

4.5 ★ → 4.1 ★ → 4.1 ★ → 4.2 ★

A product with a 4.2-star rating appeared after products with 4.1-star ratings. The same inconsistent order remained even after refreshing the page.

Evidence

Screenshot: Products displayed in an inconsistent rating order after selecting “Avg. Customer Review” sorting.

Bug 3: Stale Cart Data Displayed After Using Browser Back Button

Severity: High

Type: Functional Issue / Cart Issue

Steps to Reproduce

1. Open Amazon India.
2. Search for a product and add it to the cart.
3. Go to the cart page.

4. Remove the product from the cart.
5. Navigate to another page.
6. Use the browser Back button to return to the cart.
7. Observe the cart details.

Expected Result

The cart should show the latest updated information after returning to the page.

Actual Result

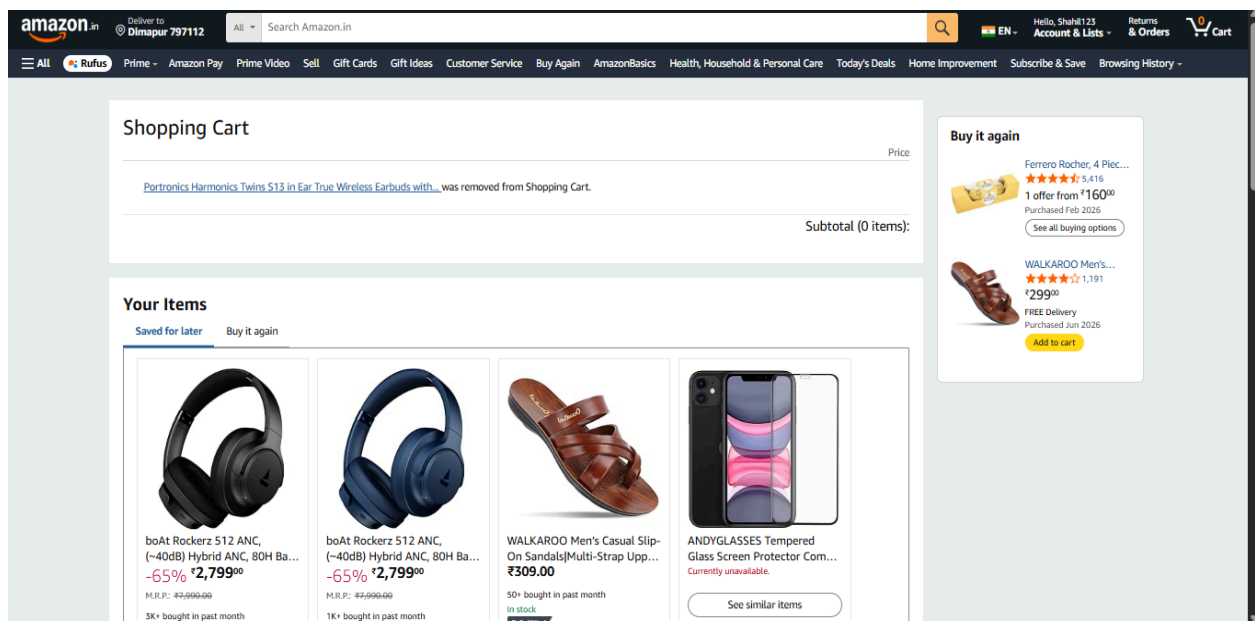

Old cart information was displayed after using the browser Back button, instead of immediately showing the latest cart data.

Impact

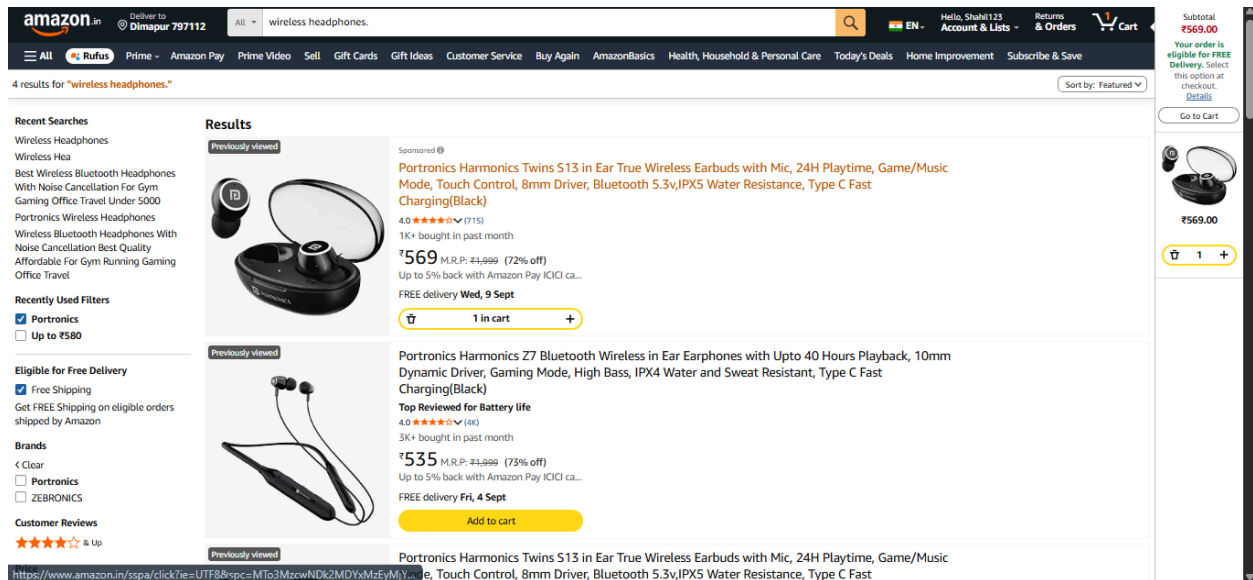

This can confuse users because they may see products or cart information that has already been changed or removed.

Evidence

Screenshot 1: The cart/product state before navigating away or after making the change.

Screenshot 2: After pressing the browser **Back** button, showing the old/stale cart information.

Bug 4: Town/City Field Accepts Numeric-Only Values and Saves the Address

Severity: Medium

Type: Input Validation / Functional Issue

Steps to Reproduce

1. Open Amazon India.
2. Go to Account → Your Addresses.
3. Click Add address.
4. Fill in all the required details with valid information.
5. In the Town/City field, enter a numeric-only value such as Dimapur123456.
6. Continue with the address verification process.
7. Save the address.

Expected Result

The Town/City field should accept a valid city name and should not allow a numeric-only value.

Actual Result

The system accepted 123456 in the Town/City field and successfully saved the address.

Impact

Invalid address information can be saved, which may lead to incorrect or unusable delivery addresses.

Evidence

Screenshot 1: Show the address form where you entered a numeric-only value in the Town/City field.

Bug 5: Address Full Name Field Accepts Numeric-Only Input

Severity: Medium

Type: Input Validation / Functional Issue

Steps to Reproduce

1. Open Amazon India.
2. Go to **Account** → **Your Addresses**.
3. Click **Add address**.
4. Enter a numeric-only value in the **Full Name** field, for example 123456.
5. Fill in all other required address details with valid information.
6. Click **Save Address**.

Expected Result

The **Full Name** field should accept a valid name and should reject numeric-only input.

Actual Result

The system accepted a numeric-only value in the Full Name field and allowed the address to be saved successfully.

Impact

Invalid recipient information can be saved in the delivery address, which may cause incorrect address details.

Evidence

Screenshot 1: Numeric-only value entered in the Full Name field.

Update address

Screenshot 2: Address saved successfully despite the Full Name field containing a numeric-only value.

Bug 6: Account Name Field Accepts Invalid Numeric and Special-Character Values

Severity: Medium

Type: Input Validation / Functional Issue

Steps to Reproduce

1. Open Amazon India.
2. Go to Account → Login & Security.
3. Click Edit next to the Name field.
4. Enter a numeric-only value such as 123456.

5. Click Save changes.
6. Repeat the test with a special-character-only value such as @@@###.

Expected Result

The Name field should accept a valid name and reject invalid values containing only numbers or special characters.

Actual Result

Amazon accepted both numeric-only and special-character-only values and successfully updated the account name. A “Success – Name updated” message was displayed.

Impact

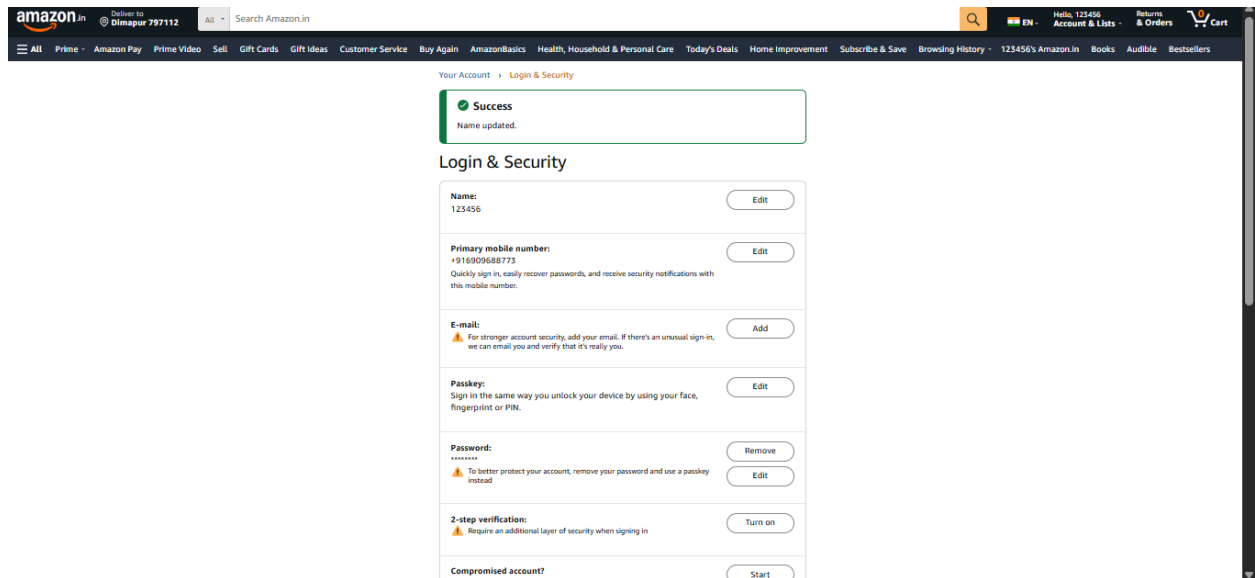

Invalid account information can be saved, which may result in incorrect user profile details.

Evidence

Screenshot 1: Invalid numeric/special-character value entered in the account name field.

The screenshot shows the Amazon India website's 'Change Your Name' page. The browser address bar displays a URL with an appActionToken. The page header includes the Amazon.in logo, delivery location (Dimapur 797112), a search bar, and user account information (Hello, SHAHIL). The main heading is 'Change Your Name'. Below it, a message states: 'If you want to change the name associated with your Amazon customer account, you may do so below. Be sure to click the Save Changes button when you are done.' The 'New name' input field contains the text '123456'. A yellow 'Save changes' button is located below the input field. The footer contains four columns of links: 'Get to Know Us', 'Connect with Us', 'Make Money with Us', and 'Let Us Help You'.

Screenshot 2: The registration process proceeded despite the invalid account name input.

Bug 7 : Wired Earphones Displayed in Search Results for “Wireless Headphones”

Severity: Low

Type: Search Relevance / Functional Issue

Steps to Reproduce

1. Open Amazon India.
2. Enter “**wireless headphones**” in the search bar.
3. Perform the search.
4. Scroll through the displayed search results.
5. Observe the product titles and product types.

Expected Result

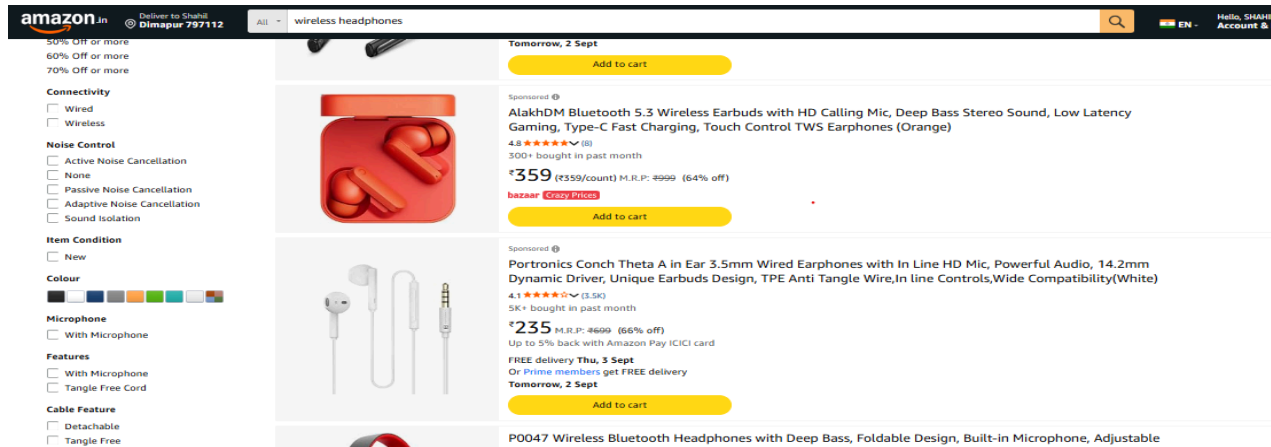

The search results should display products relevant to the search query “**wireless headphones.**” Products explicitly identified as **wired earphones** should not appear as relevant results for this query.

Actual Result

A product titled **“Portronics Conch Theta A In Ear 3.5mm Wired Earphones”** appeared in the search results for **“wireless headphones.”** The product is explicitly described as a **wired earphone**, making it inconsistent with the user's search intent for wireless headphones.

Evidence

Screenshot: Wired earphones displayed in the search results despite searching for “wireless headphones.”

Bug 8: Wireless Mouse Displayed in Search Results for “Wireless Headphones”

Severity: Low

Type: Search Relevance / Functional Issue

Steps to Reproduce

1. Open Amazon India.
2. Enter **“wireless headphones”** in the search bar.
3. Perform the search.
4. Scroll through the displayed search results.
5. Observe the product titles and categories.

Expected Result

The search results should display products relevant to **wireless headphones**.

Actual Result

A **wireless mouse** product appeared in the search results for “**wireless headphones**,” even though it is unrelated to the user's search.

Impact

Irrelevant search results can make it harder for users to find the intended product and may negatively affect the shopping experience.

Evidence

Screenshot: A wired gaming mouse displayed in the search results for “wireless headphones.”

The screenshot shows the Amazon India homepage with the search bar containing "wireless headphones". The search results are displayed in a grid. The first result is a pair of wired headphones. The second result is a pair of wireless earbuds. The third result is a wired gaming mouse, which is irrelevant to the search query. The left sidebar shows filters for price, discounts, technology, and form factor. The top navigation bar includes the Amazon logo, delivery location, search bar, and account links.

UAT Feedback

Overall User Experience

Overall Amazon is easy to use for searching products looking at product details putting products in the cart and going toward checkout. Most of the features worked correctly during testing. However I noticed some problems that could impact the user experience especially when it comes to search relevance, product sorting and input validation. In some cases products that did not match the search appeared in the results, which could make it harder for users to find what they really want.

Top 5 UX Issues

1. Irrelevant Products in Search Results: While looking for headphones unrelated items like wired earphones and a wireless mouse showed up in the results. This makes it harder. Takes more time for people to find the thing they really want.
2. Product Sorting Can Be Confusing: When using the "Avg. Customer Review" sorting option the products did not always show up in an order based on their ratings. This can confuse people who think that the rated products should come first.
3. Invalid Information Can Be Entered Easily: Some parts of the form allowed information, like names that are only numbers or numbers, in the Town/City field. Better checks would make things clearer. Stop people from saving wrong details.
4. Outdated Cart Information After Navigation: After using the browser Back button old cart information showed up for a time before the page refreshed. This might make people wonder if their cart has really changed.
5. Search Results Require Checking: Because some unrelated items still showed up even for a specific search term people might have to look carefully at product titles and details instead of trusting the search results completely.

Top 3 Confusing Flows

1. Finding the Right Product Through Search: The search process can be confusing because products that don't match the search terms show up along with the products. For example when looking for headphones, wired earphones and a wireless mouse also appeared in the search results. This means people have to spend time looking at product titles to make sure they are getting what they want.
2. Understanding Product Sorting: The "Avg. Customer Review" sorting option was confusing because the products didn't show up in an order based on their ratings. Someone who picks this option usually expects to see the rated products first.
3. Cart Information After Browser Navigation: After changing the cart and using the browser Back button old cart information showed up for a time. This can make it hard to tell if the cart was actually updated or if the person needs to refresh the page to see the changes.

Suggestions for Improvement

1. Improve Search Relevance: Amazon should improve search matching so that products unrelated to the user's search are less likely to appear. For example, searching for **wireless headphones** should prioritize wireless headphone products over wired earphones or unrelated categories.
2. Make Sorting Results More Consistent: Sorting options should clearly follow the selected criteria. For **Avg. Customer Review**, higher-rated products should appear before lower-rated products so users can easily understand the results.
3. Improve Input Validation: Fields such as **Name** and **Town/City** should validate user input before allowing it to be saved. Numeric-only or special-character-only values should be rejected where they are not valid.
4. Keep Cart Information Updated: The cart should always show the latest information, including after browser navigation. Users should not need to manually refresh the page to see the correct cart state.

5. Show More Relevant Search Results: Better filtering and ranking of search results would reduce the time users spend checking irrelevant products and make product discovery easier.

Test Coverage Summary

Areas Tested

The following areas of the Amazon web experience were tested:

- Search and Product Discovery
 - a. Product searches
 - b. Search result relevance
 - c. Search suggestions
 - d. Invalid and special-character searches
- Filters and Sorting
 - a. Brand filters
 - b. Price filters
 - c. Customer rating filters
 - d. Frequent filter switching
 - e. Sorting options
- Product Detail Page
 - a. Product information
 - b. Product images and zoom
 - c. Product variants
 - d. Customer reviews and ratings
 - e. Product page navigation
- Cart
 - a. Adding products to the cart
 - b. Updating product quantity
 - c. Removing products
 - d. Save for Later functionality
 - e. Cart state after browser navigation

- Address and Account
 - a. Address field validation
 - b. PIN code validation
 - c. Name validation
 - d. Town/City validation
 - e. Account registration
 - f. Login & Security settings
- Checkout Flow
 - a. Proceeding from cart toward checkout
 - b. Login/address redirection
 - c. Order summary checks up to the login/payment stage
- Exploratory Testing
 - a. Invalid inputs
 - b. Special characters
 - c. Rapid actions
 - d. Repeated filter switching
 - e. Edge-case input validation

Areas Not Tested

The following areas were not fully tested:

1. Actual payment completion
2. Final order placement
3. Order cancellation and return process
4. Refund process
5. Prime membership features

These areas were outside the main testing journey or were not completed to avoid making an actual purchase.

Assumptions

1. Testing was performed using a normal user account.
2. Product availability and prices may change dynamically.
3. Search results may vary based on location, availability, and Amazon's recommendations.
4. The checkout flow was tested only until the login/payment stage, as required by the assignment.

Sample Test Cases

Test Case	Steps	Expected Result	Status
TC-01: Search for a Product	Search for “wireless headphones”	Relevant products related to wireless headphones should be displayed	Pass
TC-02: Apply Brand Filter	Search for a product and apply a brand filter	Only products matching the selected brand should be shown	Pass
TC-03: Sort by Avg. Customer Review	Search for a product and select Sort by → Avg. Customer Review	Higher-rated products should appear before lower-rated products	Fail
TC-04: Add Product to Cart	Open a product and click Add to Cart	The selected product should be successfully added to the cart	Pass
TC-05: Update Product Quantity	Change the quantity of a product in the cart	The quantity and cart details should update correctly	Pass
TC-06: Remove Product from Cart	Remove a product from the cart	The product should be removed and the cart should show the updated state	Pass
TC-07: Address Full Name Validation	Enter a numeric-only value in the Full Name field and save the address	The system should reject invalid numeric-only names	Fail
TC-08: Town/City Validation	Enter a numeric-only value in the Town/City field and save the address	The system should reject numeric-only values	Fail
TC-09: Account Registration Name Validation	Enter an invalid numeric-only or special-character-only value in Your Name during registration	The system should show a validation error and prevent proceeding	Fail
TC-10: Account Name Update Validation	Enter numeric-only or special-character-only values while editing the account name	The system should reject invalid name formats	Fail

Cross-Browser Testing

Browsers Tested:

1. Google Chrome
2. Microsoft Edge

Observations

The main user journey, which includes searching for products applying filters, opening product pages adding products to the cart and proceeding toward the checkout page was tested on both Google Chrome and Microsoft Edge. No major browser-specific UI issues were observed during the testing. The website layout and main user journey were generally consistent, across both browsers.

Automation Approach

If I were to automate this Amazon user journey, I would use Selenium with Java to automate the main flows.

The automation could cover:

1. Searching for a product
2. Applying filters
3. Sorting products
4. Opening a product page
5. Adding a product to the cart
6. Updating product quantity
7. Removing products from the cart
8. Proceeding toward checkout until the login stage

I would use the Page Object Model (POM) to keep the automation code organized and easy to maintain. TestNG could be used for test execution and assertions. The main functional scenarios could be automated as regression tests. However, exploratory testing and UX-related issues would still require manual testing.
